# No Idea!

 by [sandydeep](#)

Problem

[Submissions](#)[Leaderboard](#)[Discussions](#)[Editorial](#)

There is an array of  $n$  integers. There are also 2 **disjoint sets**,  $A$  and  $B$ , each containing  $m$  integers. You like all the integers in set  $A$  and dislike all the integers in set  $B$ . Your initial happiness is 0. For each  $i$  integer in the array, if  $i \in A$ , you add 1 to your happiness. If  $i \in B$ , you add  $-1$  to your happiness. Otherwise, your happiness does not change. Output your final happiness at the end.

**Note:** Since  $A$  and  $B$  are sets, they have no repeated elements. However, the array might contain duplicate elements.

## Constraints

$$1 \leq n \leq 10^5$$

$$1 \leq m \leq 10^5$$

$$1 \leq \text{Any integer in the input} \leq 10^9$$

## Input Format

The first line contains integers  $n$  and  $m$  separated by a space.

The second line contains  $n$  integers, the elements of the array.

The third and fourth lines contain  $m$  integers,  $A$  and  $B$ , respectively.

## Output Format

Output a single integer, your total happiness.

## Sample Input

```
3 2
1 5 3
3 1
5 7
```

## Sample Output

```
1
```

## Explanation

You gain 1 unit of happiness for elements 3 and 1 in set  $A$ . You lose 1 unit for 5 in set  $B$ . The element 7 in set  $B$  does not exist in the array so it is not included in the calculation.

Hence, the total happiness is  $2 - 1 = 1$ .
